

71131 and 71151

Soil

144 and 71 grams

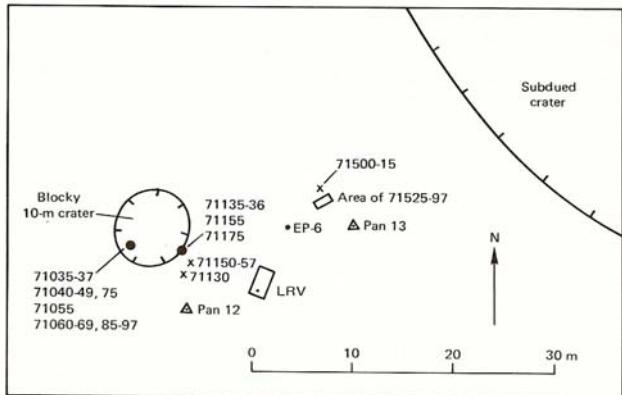

Figure 1: Map of station 1a, Apollo 17.

Introduction

Soil samples 71130 and 71150 were collected close to a basalt boulder on the rim of a small blocky crater at station 1 (figure 1). They include numerous basalt fragments.

Petrography

Morris (1978) determined the maturity index (I_s/FeO) of 71131 and 71151 as 33 and 34, respectively. The small blocky crater is probably young (Wolfe et al. 1981).

Chemistry

The chemical composition of these soils is the same as for 71501 which is representative of mare soil at this site (figures 2 and 3).

Cosmogenic isotopes and exposure ages

O'Kelley et al. (1974) determined the cosmic-ray-induced activity of $^{22}\text{Na} = 62 \text{ dpm/kg}$, $^{26}\text{Al} = 69 \text{ dpm/kg}$, and $^{54}\text{Mn} = 102 \text{ dpm/kg}$.

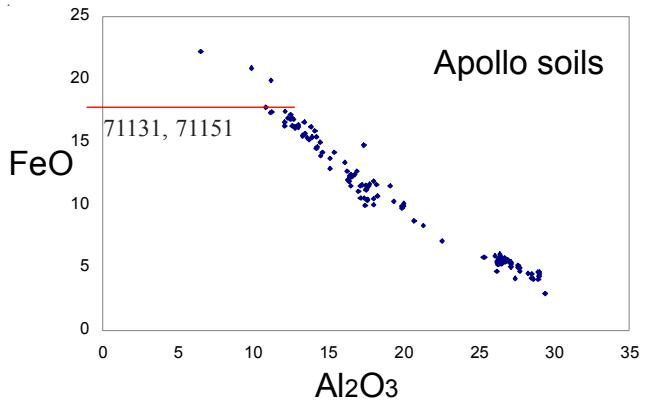

Figure 2: FeO content of 71131 and 71151 compared with composition of other Apollo soils.

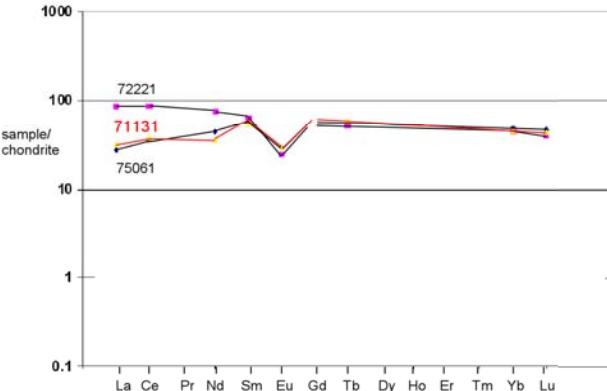

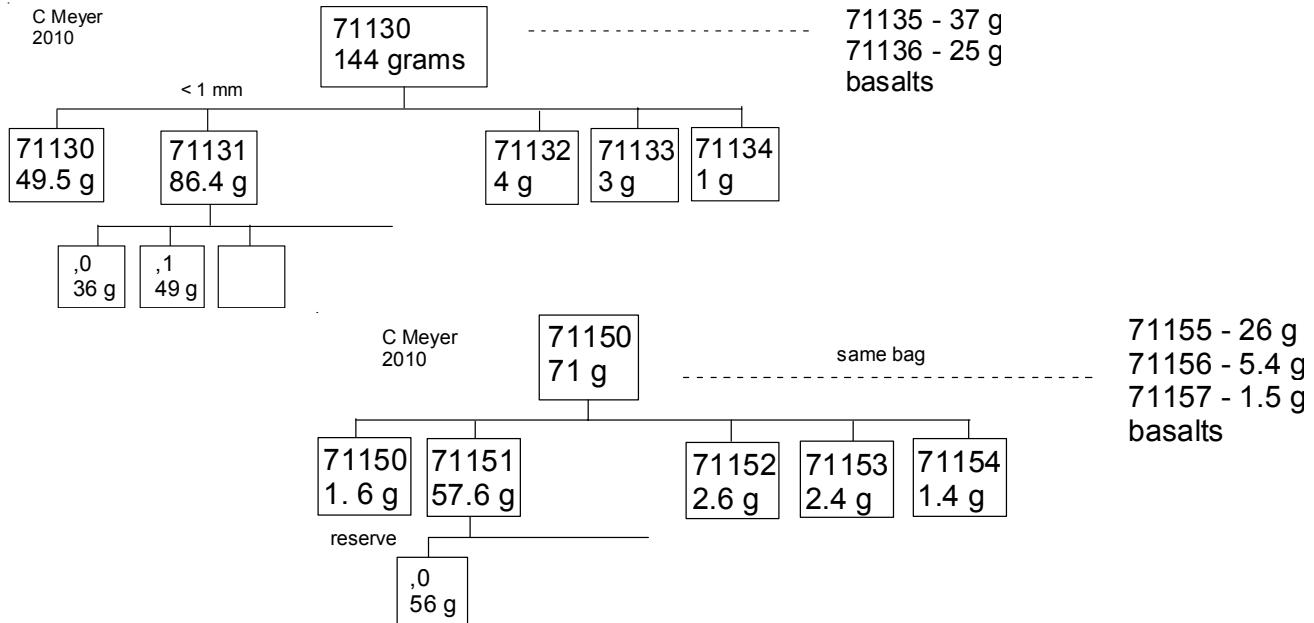

Figure 3: Normalized rare-earth-element diagram for 71131 and 71151. Note similarity with mare soil 75061.

Table 1. Composition of 71131 and 71151.
